1 Serial Data Transmission

1.1 Connector Assignment (9-pin DSUB Socket)

| Pin | Signal | Description |
|-----|--------|------------------------|
| 2 | T x D | Transmitting data line |
| 3 | R x D | Receiving data line |
| 5 | GND | GND signal |
| 7 | CTS | HW Handshake |
| 8 | RTS | HW Handshake |

1.2 Connection Plan RS232

Software Handshake Printer (DSUB 9 plug) PC (DSUB 25 socket)

Printer (DSUB 9 plug) PC (DSUB 9 socket)

Hardware Handshake Printer (DSUB 9 plug) PC (DSUB 25 socket)

Printer (DSUB 9 plug) PC (DSUB 9 socket)

2 Parallel Data Transmission

2.1 Connection Plan

| Signal Pin no. | Signal name | Direction | Function |
|----------------|-------------|-----------|--|
| 1 | STROBE | (Input) | The STROBE signal indicates that data can be received. The impulse width to the receiving line has to be 0,5 µs at least. |
| 2 | DATA 0 | (Input) | The signals are data bits sent to the printer. A HIGH level corresponds to logical 1 and a LOW level to logical 0. |
| 3 | DATA 1 | (Input) | |
| 4 | DATA 2 | (Input) | |
| 5 | DATA 3 | (Input) | |
| 6 | DATA 4 | (Input) | |
| 7 | DATA 5 | (Input) | |
| 8 | DATA 6 | (Input) | |
| 9 | DATA 7 | (Input) | |
| 10 | ACK/ | (Output) | An impulse of approx. 12 µs confirms data input for a LOW level and signalises the further listening watch of the printer. |
| 11 | BUSY | (Output) | A HIGH level indicates that the printer cannot receive any data. On the following conditions the signal HIGH is possible: 1) for data input (impulse for each sign) 2) during a printing process 3) in Offline status 4) for printer failures |
| 12 | PE | (Output) | A HIGH level indicates that paper is used up. |
| 13 | SELECT | (Output) | High Online |
| 14 | AUTOFEED | | |
| 15 | FAULT/ | (Output) | Signal goes to LOW, in case 1) the paper is used up 2) the printer is Offline or 3) an error occurs. |
| 16 | INIT/ | (Input) | A LOW level initializes the printer |
| 17 | SELECTIN/ | (Input) | A LOW level informs the printer to be addressed |
| 18-25 | GND | | |

3 Text, Bar Code, Graphic

3.1 Definition of Rotation

3.2 Definition of Datum Point

The so-called datum point is the relation point for indication of position. In the meantime the datum point is also the point at which the selected object is rotated.

To determine the datum point in the mask sets, the possible datum points are numbered from left top (1) to right bottom (9). The default datum point is left bottom (7). This datum point is also used even if no indication is found in the mask set.

4 Data Format

The data format consists of four parties:

- Mask set
- Text
- Graphic
- Command

For a n-line label the following has to be transmitted:

- n - mask sets
- n - text sets
- n - graphic sets (if necessary)
- 1 - command set

NOTICE!

The command set always has to be transmitted at the end!

To each text on a label belong one MASK SET and one TEXT SET with the same field number.

To each code on a label belong one MASK SET, one TEXT SET and one CODE SET with the same field number.

To each box or line on a label belongs only one MASK SET.

To each graphic on a label belong several GRAPHIC SETS according to its size res. height, e.g. a graphic with a height of 10 mm needs 80 graphic sets.

Examples

| | |
|---|---|
| Label with 3 lines of text: | 3 mask sets 3 text sets 1 command set |
| Label with 2 lines of text, 1 box and 3 lines | 6 mask sets 2 text sets 1 command set |

For ALL data sets the following is valid:

Each set starts with
SOH = start of header → HEX format 01

Each set ends with
ETB = end of data transmission block → HEX-Format 17

Alternatively it is possible to set SOH to 5E_{Hex} and ETB to 5F_{Hex}. This is necessary if the connected system (e.g. UNIX) cannot transfer control signs.

All other data sets → ASCII format, but they will be transmitted as hexadecimal characters.

Example

A = identification of mask set - transmission: 41_{HEX}
n = field number '01' - transmission: 30_{HEX}, 31_{HEX}

4.1 Explication

- x coordinate:** Distance from right label rim in mm
Measured from the right label rim up to the lower left point of the corresponding line
- y coordinate:** Distance from upper label rim in mm
Measured from the beginning of the label down to the lower left point of the corresponding line

| | | | |
|--|--------------|-----------------------------|----------------|
| Bitmap fonts (not proportional) | 01 = Font 01 | 0,8 x 1,1 mm | 127 characters |
| | 02 = Font 02 | 1,2 x 1,7 mm | 255 characters |
| | 03 = Font 03 | 1,8 x 2,6 mm | 255 characters |
| | 04 = Font 04 | 4,0 x 5,6 mm | 127 characters |
| | 05 = Font 05 | 1,8 x 3,2 mm (descender) | 255 characters |
| | 06 = Font 06 | 1,5 x 2,9 mm | 127 characters |
| | 07 = Font 07 | 1,2 x 2,2 mm (descender) | 255 characters |

| | | | |
|--|--------------|-----------|----------------|
| Bitmap fonts (proportional) | 21 = Font 21 | (1,0; 13) | 255 characters |
| | 22 = Font 22 | (1,8; 21) | 255 characters |
| | 23 = Font 23 | (2,6; 31) | 255 characters |
| | 24 = Font 24 | (5,6; 67) | 255 characters |
| | 28 = Font 28 | (4,0; 48) | 255 characters |
| | 29 = Font 29 | (0,8; 9) | 255 characters |

NOTICE!

In order to reach best print results it is recommended always to choose the biggest possible font.

**Vector fonts
(proportional)** When in mode 'proportional text', the height and width of text have to be entered in mm.
These values refer to the capital 'M', i.e. the values of other characters are changing in proportion.

**Vector fonts
(autoscale)** When in autoscale mode, height and width of text has to be entered in mm.
The height of the text refers to all capital letters. When using small characters and descenders the height is changing in proportion. When entering the width, the complete file has to be considered. The text will be adjusted automatically, which means that the width of the characters is changing.

4.2 Definition of Field Attributes/Field Properties (optional)

Explanation

Additionally, to mask set 'AM[] ...' the possibility was created to define further field properties. In order to achieve a high flexibility, the field properties received own names/identifications. Therefore, the sequence as well as the number of field properties is free. If necessary, the mask set 'AC[]' is transferred additionally to mask set 'AM[]' to the printer.

Structure mask set

(SOH)AC[]at1=*value*;at2= *value*;... (ETB)

| Attribute (at): | Description |
|-----------------|--|
| BT | ITF 14 (see page 22) bearer bar type |
| BW | bearer bar width |
| QZ | quiet zone in 1/100 mm |
| NAME | Field name (see page 14) definition of field name |
| FN | Field number (see page 18) Free definable field number |

This table is constantly extended. The current version is available on demand.

4.3 Field Name

Application (customized)

When label printers are connected to a computer system or machine controls, there is often the requirement that variable data is to be inserted into an existing layout. This data contents come from the superordinate computer system (database) or a machine control (e.g. PLC, scale, ERP system, etc.). Basically, it was always possible to integrate variable data into a 'loaded' layout (mask). The access to certain fields has been effected via the field index, i.e. a consecutive number. This field index is generated by Labelstar Office and can also change with layout changes, whereby the data allocation to the computer system/control is no longer correct.

Example

Print data

```
...
// TEXT (1/100 mm)
(SOH)AM[1]2405;803;0;1;2;4;1;1;0(ETB)
(SOH)BM[1]Feld 1(ETB)
// TEXT (1/100 mm)
(SOH)AM[2]421;856;0;1;2;4;1;1;0(ETB)
(SOH)BM[2]Feld 2(ETB)
// LINES: 2
...
```

The print data contains the definitions for the two text fields. The field index is always in '[]' of the mask or text setting.

If the text field 'Feld 1' is deleted on the label and then recreated, it gets a new index. In this case '2'. The text field 'Feld 2' gets the index '1'. As a result, an assignment via the field index is used only to a limited extend, without manual post-processing of the layout data.

Explanation

As an alternative to the field index, the assignment can also be made via the field name. A change in the field index has no longer any influence, and a changed layout is still filled in the right places with variable data of the computer system/control system.

Labelstar Office: The print data is supplemented by the following line:

(SOH)AC[1]NAME="**Field name**"(ETB)

The field content defined via the text block can be changed by the computer system/control with the following command:

(SOH)BV[**Field name**]Feld 2(ETB)

This results in the following standard procedure for the connection to a high-level control and/or computer system.

Label design with Labelstar Office

The field names are automatically transferred by Labelstar Office.

The desired field name (Field1) is entered in the properties of the text field.

For text fields, a printer-internal font must be used. The printer-internal fonts are marked by a printer symbol in the list.

Export to a print file and save the layout in the external controller

When the label design is finished, the label is exported to a print file. For this, Labelstar Office uses the function **File – Export – Create Print Template**.

The option **Create separate data file** must be selected, otherwise the line (SOH)**FBC---r-----(ETB)** is included in the print file, which would immediately release a print procedure.

By starting a print procedure, this print file (layout definition / mask definition) is transferred from the controller/computer system to the printer first.

Save the layout on the memory card of the printer

As an alternative to 'Export to a print file' the label layout is saved on the memory card of the printer. For this, the memory card tool from Labelstar Office can be used.

The layout must be called by the controller/computer system **before** filling the variable fields.

The following parameter set is used:

(SOH)**FMA---rfilename(ETB)**

The path name is determined when saving and possibly contains a path.

Example: "A:\Standard\et1".

Filling the variable fields by the controller/computer system

The higher-level control can select the variable fields by the field names and set the contents. Subsequently, the print job is restarted.

| | | |
|----------------|---------------------------------------|--|
| Example | (SOH) FMB---rfilename (ETB) | Loading the layout from mc |
| | (SOH) BV[ArtBez]screws (ETB) | Filling the field "ArtBez" with "screws" |
| | (SOH) BV[ArtNr]123456789 (ETB) | Filling the field "ArtNr" with "123456789" |
| | (SOH) FBC---r----- (ETB) | Start printing |

4.4 Field Selection by Free Definable Field Number

With the following described attribute it is possible to assign a free definable field number to a field. This field number does not have to be clear, i.e. several fields can have the same field number. In this way the same field contents can be assigned to different fields.

The following attribute identification is defined:

Attribute: **FN**

Description: free definable field number

After the field number was assigned with AC mask statement,

(SOH) **AC [n] FN=nr** (ETB)

n = field index

nr = free definable field number

it is possible to access to the field and/or the fields with the new BF text statement:

(SOH) **BF [nr] text** (ETB)

nr = field number

text = field contents

Example

```
// Assignment of field number field 1 and field 2
(SOH)AM[1]1000;2500;0;4;2;7;400;400;0(ETB)
(SOH)AC[1]FN=100(ETB)
(SOH)AM[2]2000;2500;0;30;2;4000;9;3;0;1(ETB)
(SOH)AC[2]FN=100(ETB)

// Access to field 1 and field 2 by field number
(SOH)BF[100]1234567890(ETB)
```

5 Mask Set

5.3 ITF Bar Code

| AM[n]y;x;p;a;d;h;v1;v2;pz;z;dp | |
|---------------------------------------|---|
| A | identification for mask set |
| M | identification for protocol version |
| n | Field number |
| y | Y position in 1/100 mm |
| x | X position in 1/100 mm |
| p | identification for phantom field 0 = print 1 = no print |
| a | identification for field type 56 = ITF 14 |
| d | rotation 0 = 0° 1 = 90° 2 = 180° 3 = 270° |
| h | symbol height in 1/100 mm |
| v1 | relation 1; module width 'THICK' |
| v2 | relation 2; module width 'THIN' and/or SC factor |
| pz | check digit calculation 0 = no check digit calculation 1 = check digit calculation 4 = inverse - no check digit calculation 5 = inverse - check digit calculation |
| z | human readable line 0 = no human readable line 1 = with human readable line |
| dp | datum point 1 = left top 2 = centre top 3 = right top 4 = left centre 5 = centre centre 6 = right centre 7 = left bottom (default) 8 = centre bottom 9 = right centre |

In order to print the bearer bars of an ITF 14 barcode, the following additional properties for Code 2/5 interleaved must be set:

For this the following field properties are determined:

| Property identifier | Description |
|---------------------|--|
| BT | bearer bar type 0 = no bars 1 = above/below 2 = rectangle |
| BW | bearer bar width in 1/100 mm |
| QZ | quiet zone in 1/100 mm |

Example

```
// BARCODE (1/100 mm)
(SOH) AM[1]4498;7076;0;31;2;3000;12;4;0;1;3 (ETB)
(SOH) AC[1]BT=2;BW=150;QZ=600 (ETB)
(SOH) BM[1]1234567890123 (ETB)
```

12340678901236

: graphic data in PCX format

⊗: SOH (1_{hex} bzw 5E_{hex})

⊕: ETB (17_{hex} bzw. 5F_{hex})

C_R: CarriageReturn (0D_{hex})

L_F: LineFeed (0A_{hex})

7 Graphic Set

7.1 General Graphic Format

This format is supported by all our printers but note that a 8 bit transmission is absolute necessary.

| SOH | D | p | p | p | p | lb | lb | lb | b | b | b | b | gb..... | ETB

| | | | min. | max. |
|-----------|---|--------------------------------|--------|--------|
| D | = | identification for graphic set | | |
| p | = | pixel line from above | '0000' | '1900' |
| lb | = | 1. byte from left | '000' | '100' |
| b | = | quantity of bytes | '1' | '100' |
| gb | = | graphic bytes | | |

Graphic byte

1 graphic bit = 0,083 x 0,083 mm

7.2 Graphic in PCX Format

It is possible to transfer graphic data as a PCX-file (e.g. PaintBrush) to the printer. With this type of data transfer the PCX-file is transferred in a compressed form. Hereby the RLE-procedure is used and therefore the graphic data were reduced by approx. 30 %. This means that the effective transferring time for 300 dpi printers is cut in halves.

To set the printer ready for receiving PCX-data the protocol has to be switched over and hereby the following command set will be defined:

SOH A X n n n v v v v v v x x x x x x m dp ETB

- It is recommended to observe that directly after the final sign (ETB) no separator res. fill character such as $C_R L_F$ is indicated.
- The printer supports the following PCX versions: 5, 3, 2 and 0.
- It is necessary that the corresponding PCX-file is available as monochrome (black/white).
- The graphic has to be available in the original size as the printer is not able to change the size by itself.

**NOTICE!**

Before print start, indicated by parameter set 'FBC', the definition of field number, lines and pieces has to be effected via the parameter sets (FBA res. FBB).

7.3 Example PCX File

8 Variables

8.1 Set Structure

| | | | | | | | | | | | | | | | | |
|-----|----|-----|---|---|---|---|----|----|-----|----|---|----|----|-----|-----|-----|
| SOH | BM | [n] | = | v | v | (| p1 | p2 | p.. | pn |) | t1 | t2 | t.. | t70 | ETB |
|-----|----|-----|---|---|---|---|----|----|-----|----|---|----|----|-----|-----|-----|

= start of function
 vv variable type
 SC link field
 CN counter
 CC extended counter
 CL date/time
 CU currency variable
 SH shift variable
 MD memory card data
 (start of variable parameter block
 p1...pn variable parameter
) end of variable parameter block

NOTICE!

In case you want to print a text which corresponds exactly to the variable definition then you have to place '!' before.

| | | | | | | | | | | | | | | | | | |
|-----|----|-----|---|---|---|---|---|----|----|-----|----|---|----|----|-----|-----|-----|
| SOH | BM | [n] | ! | = | v | v | (| p1 | p2 | p.. | pn |) | t1 | t2 | t.. | t70 | ETB |
|-----|----|-----|---|---|---|---|---|----|----|-----|----|---|----|----|-----|-----|-----|

8.2 Link Field

| | | | | | | | | | | | | | | | | | | | |
|-----|----|-----|---|---|---|---|----|---|----|---|-----|---|----|---|----|----|-----|-----|-----|
| SOH | BM | [n] | = | S | C | (| p1 | ; | p2 | ; | p.. | ; | pn |) | t1 | t2 | t.. | t70 | ETB |
|-----|----|-----|---|---|---|---|----|---|----|---|-----|---|----|---|----|----|-----|-----|-----|

= SC identification of link field
 p1...pn identification of link elements (field number or constant text)
 field number is entered without leading '0'
 constant text is included in " but these marks are not printed

NOTICE!

Reference fields can be constant text or variables but no link fields.

Example

=SC(1;2;3) --> Printout: Field1Field2Field3

=SC(1;"constant";2) --> Printout: Field1constantField2

8.3 Counter

| | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----|----|-----|---|---|---|---|---|---|---|---|---|---|-----|---|---|---|---|---|---|---|---|----|----|-----|-----|-----|
| SOH | BM | [n] | = | C | N | (| t | ; | m | ; | c | ; | +/- | s | ; | i | ; | h | ; | r |) | t1 | t2 | t.. | t70 | ETB |
|-----|----|-----|---|---|---|---|---|---|---|---|---|---|-----|---|---|---|---|---|---|---|---|----|----|-----|-----|-----|

| | |
|---|---|
| = CN | identification counter |
| t | type of counter |
| 0 | numerical |
| 1 | letters only |
| 2...36 | radix, base of the counter |
| m | function mode |
| 0 | standard |
| 1 | return to start value |
| 2 | enter the start value at the beginning of printing (default = existing start value) |
| 3 | enter the start value at the beginning of printing (default = last final number) |
| 4 | reset start value at cycle end (only for DPM III) |
| 5 | reset start value by I/O signal |
| 6 | time-controlled resetting |
| 7 | time-controlled resetting with input of initial value (default = last final value) |
| c | digit where the numbering starts counting |
| +/- | direction |
| + | adding |
| - | subtracting |
| s | step width |
| i | update interval (number of labels with identical number) |
| h | time by which the counter is reset (function mode 6 and 7) in format 'HH:MM' e.g. 00:00 = reset counter at 0:00 (optional, only for function mode 6 and 7) |
| r | reset value (optional, only for function mode 6 and 7; default = text and/or initial value) |
| Limitation: | |
| The time-controlled resetting of counter variable is only effected in case of an active print order. If a print order is cancelled before the specified time and afterwards again restarted then no resetting of counter value is effected. | |
| t1, t2, ... | text res. start value of counter |

Example:

Input: =CN(10;7;4;+1;1;06:00;0001)1234

The enquiry for the initial value is effected at print start and at 6:00 the counter variable is reset to value 0001.

8.4 Extended Counter

| | | | | | | | | | | | | | | | | | | | | | |
|-----|----|-----|---|---|---|---|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|
| SOH | BM | [n] | = | C | C | (| +/- | s | ; | i | ; | m | ; | z | ; | n | ; | x |) | t | ETB |
|-----|----|-----|---|---|---|---|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|

- = CC identification of numeric counter
- +/- direction
 - + counter adding
 - counter subtracting
- s step width
- i update interval
(number of labels with identical number)
- m function mode
 - 0 standard
 - 1 return to start value
 - 2 enter the start value at the beginning of printing
(default = existing start value)
 - 3 enter the start value at the beginning of printing
(default = last final number)
 - 4 reset start value at cycle end
(only for DPM III)
 - 5 set min. / max. value
 - 6 set start value
 - 7 print end
- z leading zeros
 - 0 no leading zeros
 - 1 printout with leading zeros
- n minimum value (max. -999999999)
- x maximum value (max. 999999999)
- t start value
(the number of digits determines the format for the printout with
leading zeros
(max. 999999999)

Example:

Input: =CC(+1;2;5;0;1,999)0050

Printout: 50, 51,...999, 1, 2, ...

8.5 Date and Time

SOHBM[n]=CL(m;d;i;n;c;mo;pd;pm;md;mm;rw;ws)t1t..t70ETB

= CL identification date/time

m month offset to the actual date
(negative value/entry possible)

d day offset to the actual date

i update interval
(0 = at the beginning of a print order, 1 = each label)

Optional parameters

n minute offset to the actual time
(negative entry/value possible)

c correction month overflow
(0 = change to the next month, 1 = remain in current month)

Optional parameters for BBE date

mo input mode
0: standard; display current date of real time clock
1: display calculated date, modification possible
2: display calculated date, no modification possible

pd max. positive correction days

pm max. positive correction months

md max. negative correction days

mm max. negative correction months

Optional parameters for rounded date

rw rounded weekday: 1 = Sunday ... 7 = Saturday; 0 = no rounding

ws start of week, format: "D-HH:MM",
e.g. 1-00:00 = Sunday, 0:00 Uhr

Example

Actual date as per Real Time Clock: 08.12.

Input: =CL(0;0;0)<DD.MO.> Printout: 08.12.
Input: =CL(2;1;0)<DD.MO.> Printout: 09.02.

Example for BBE date

Input: =CL(0;0;0;0;0;1;3;2;3;2)<DD.MO.>

At print start the calculated date is displayed at the printer and can be modified (+/- 3 days and +/- 2 months):

Display: ID_1 DD:MO:YY
08.12.11

Example for rounded date

The beginning of the week is on Sunday (08.12.) at 00:00. The date of Monday should be printed the whole week.

Input: =CL(0;0;0;0;0;0;0;0;0;2;1-00:00)<DD.MO.>

| Current date | Rounded date |
|-----------------|--------------|
| 07.12. 23:59:59 | 02.12. |
| 08.12. 00:00:00 | 09.12. |
| 09.12. | 09.12. |
| 14.12. 23:59:59 | 09.12. |
| 15.12. 00:00:00 | 16.12. |

8.6 Format Identifier (Date & Time)

| Standard format | |
|------------------------|--|
| HH | Hours 2-digit (24 hours) |
| HE | Hours 2-digit (12 hours) |
| MI | Minutes 2-digit |
| SS | Seconds 2-digit |
| AM | AM/PM output |
| DD | Day 2-digit |
| MO | Month 2-digit |
| YYYY | Year 4-digit |
| YY | Year 2-digit |
| Y | Year 1-digit |
| WW | Calendar week |
| DW | Day of week (Sunday = 0) |
| DW1 | Day of week (Sunday = 1) |
| DwX | Day of week An arbitrary ASCII character can be used for x, from which it is counted consecutively |
| DOWxxxxxxxx | Day of week - variable For x, any ASCII character can be used The first ,x' denotes Sunday, the next denotes Monday and so on until Saturday For each weekday a character must be created |
| DOY | Day of year 3-digit (First January = 1) |
| DY | Day of year 3-digit (First January = 0) |
| Examples | |
| DD.MO.YY | 22.01.10 |
| MO/DD/YYYY | 01/22/2010 |
| YY-MO-DD | 10-01-22 |
| YYMODD | 100122 |

The format identifier 'HE' and 'AM'/'am'/'Am' are supplemented.
Therefore the output of hours in 12-hours mode is possible. By the additional output of format identifier 'AM' the output of time in american/english format is possible.

Example

```
=CL(0;0;0;0)<HH:MI:SS>      --> 15:30:00
=CL(0;0;0;0)<HE:MI:SS>      --> 03:30:00
=CL(0;0;0;0)<HE:MI:SS AM>    --> 03:30:00 PM
=CL(0;0;0;0)<HE:MI:SS am>    --> 03:30:00 pm
=CL(0;0;0;0)<HE:MI:SS Am>    --> 03:30:00 p.m.
```

By separating the output of time and AM/PM output in 2 text fields, also the following output format is possible:
--> 03:30:00 pm

| Extended format | |
|--|---------------------|
| XMO | Name of month short |
| XSO | Name of month long |
| XSD | Weekday short |
| XLD | Weekday long |
| | |
| For X you can enter the country identification of desired language | |
| C = Canadian | |
| D = Danish | |
| E = English | |
| F = French | |
| G = German | |
| I = Italian | |
| N = Dutch | |
| O = Norwegian | |
| S = Spanish | |
| U = Finnish | |
| W = Swedish | |
| Examples: | |
| DD.EMO.YY | 22.JAN.10 |
| DD.ESO YYYY | 22. January 2010 |
| ELD,DD.GMO.YY | Friday, 22. JAN.10 |
| ESD,DD.MO.YY | FR, 22.01.10 |

8.7 Currency Variable

| | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----|----|-----|---|---|---|---|-----|---|-----|---|-----|---|-----|---|-----|---|-----|---|-----|---|----|----|-----|-----|-----|
| SOH | BM | [n] | = | C | U | (| [a] | ; | [b] | ; | [c] | ; | [d] | ; | [e] | ; | [f] | ; | [g] |) | t1 | t2 | t.. | t70 | ETB |
|-----|----|-----|---|---|---|---|-----|---|-----|---|-----|---|-----|---|-----|---|-----|---|-----|---|----|----|-----|-----|-----|

| | |
|-------------|--|
| = CU | Signification of variable Euro |
| a | ANSI-Code of thousand separator as decimal figure |
| b | ANSI-Code of comma separator as decimal figure |
| c | Quantity of numbers after the comma as decimal figure |
| d | Operand A Before the processing the variable Euro |
| e | Operand B calculates the term |
| f | Operand C $\frac{A \times B}{C}$ |
| g | Rounding format |
| t1, t2, ... | Format string, is indicated by "< >" |

Example:

In case the contents of field 20 has to be converted from USD into EUR the definition of variable for the user defined format is as follows:

B01 '=CU(46;44;2;20;"1,0"";0,68861";"0,01")Result: <>Euro'
 B20 1.250,44 USD

Printout: 1.250,44 USD
 Result: 1.815,89 Euro*

* 1 USD = 0,68861 Euro (11.01.2010)

8.8 Shift Variable

SOH BM [n] = S H () t1 t2 t.. t70 ETB

= SH identification of shift variable

NOTICE!

The shift variable did not need any parameters. The settings for the output are defined with the corresponding parameter sets. (see above)

Beispiel

The shift times are defined: 00:00 - 11:59 "Shift1"
12:00 - 23:59 "Shift2"

| | | |
|-------|------------------------|----------|
| =SH() | Printout at 10:00 Uhr: | "Shift1" |
| =SH() | Printout at 13:00 Uhr: | "Shift2" |

Set shift times

SOH F C I D - - r N N H H M M h h m m ETB

NN = ID [01 ... 24]
HH = start hour
MM = start minute
hh = end hour
mm = end minute

Get shift variable

SOH F C I D - - w N N p p p p p p p p p p p p p p p ETB

Answer

SOH A N N H H M M h h m m p p p p p p p p p p ETB

Set shift text

SOH F C I E - - r N N T T T T T T T T T T T T T ETB

NN = ID [01 ... 24]
T = max 10 characters

Get shift variable

SOH E C I E - - w N N p p p p p p p p p p p p p p p ETB

Answer

SOH A N N : T T T T T T T T T T : p p p p p p p p p p ETB

8.9 User Guiding

| | | | | | | | | | | | | | | | | | |
|-----|----|-----|---|---|---|---|---|-----|-----|------|------|--------|----|----|-----|-----|-----|
| SOH | BM | [n] | = | U | G | (| c | ; t | ; m | ; ap | ; ae | ; sp) | t1 | t2 | t.. | t70 | ETB |
|-----|----|-----|---|---|---|---|---|-----|-----|------|------|--------|----|----|-----|-----|-----|

= UG identification user guiding
c start position for the entry
t type of entry
0 numerical
1 alphanumerical
m mode of entry
0 do not jump over special characters
1 jump over special characters
ap alignment at printing
0 aligned to the right side
ae alignment at entry
0 aligned to the right side
sp prompt text for the variable, max. 24 characters
The entry has to be included in ".

Example

Entry: =UG(1;0;0;0;0;"Enter article no."<123456>
Display: Enter article no.
123456

8.10 User Guiding with Mask

| | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----|----|-----|---|---|---|---|---|---|---|---|---|---|----|---|----|---|----|---|---|---|----|---|----|----|--------|-----|
| SOH | BM | [n] | = | U | M | (| c | ; | t | ; | m | ; | ap | ; | ae | ; | sp | ; | d | ; | ma |) | t1 | t2 | t..t70 | ETB |
|-----|----|-----|---|---|---|---|---|---|---|---|---|---|----|---|----|---|----|---|---|---|----|---|----|----|--------|-----|

= UM identification user guiding with mask
 c start position for the entry
 t type of entry (is ignored with existing mask definition)
 0 numerical
 1 alphanumerical
 m mode of entry (is ignored with existing mask definition)
 0 do not jump over special characters
 1 jump over special characters
 ap alignment at printing
 0 aligned to the right side
 ae alignment at entry
 (always left aligned with existing mask definition)
 0 right aligned
 1 left aligned, cursor at the beginning of the text
 2 left aligned, cursor at the start position
 3 right aligned, remove fill characters
 4 left aligned, cursor at the beginning of the text,
 remove fill characters
 5 left aligned, cursor at the start position,
 remove fill characters
 sp prompt text for the variable, max. 24 characters
 The entry has to be included in ".
 d deleting setpoint value
 0 setpoint value remains at key entry (inserting mode)
 1 with first key press the setpoint value disappears
 2 setpoint value is retained (overwrite mode)
 ma definition of mask
 possible mask characters are
 9 numbers only
 # only numbers and leading signs
 ? letters only
 a alphanumeric characters (letters and numbers)
 C any characters

Example

Entry: =UM (1;0;0;0;0;"Enter article no.";0;"999-aa")<123-xx>
 Display: Enter article no.
 123-xx

8.11 Memory Card Data

| | | | | | |
|-----|----|-----|---|--|-----|
| SOH | BM | [n] | = | MD(FN="filename";SE='x';CH=x;SC="x";SF="x";RC="x") | ETB |
|-----|----|-----|---|--|-----|

= MD identification of memory card data
 FN file name of table onto memory card with CSV data
 SE Separator sign (default = ';')
 CH column name in the first line (0 = no, 1 = yes)
 SC name and/or number of column that should be referenced
 SF field name and/or field index of field onto the label, which
 contains the searched data
 RC name and/or number of column, which contains the data to be
 printed

NOTICE!

If in parameter SF a field name is indicated, this must have been defined for the appropriate field by an AC attribute statement!

Example

```
AC[1]NAME="FCODE"
BM[2]=MD(FN="a:\daten.csv";SE='(';CH=1;SC="Farbcode";SF="FCODE";
RC="IC-Nummer")
```

| Field 1 | Output Field 2 |
|---------|----------------|
| 00001 | 121478242 |
| 23252 | 784587448 |

| daten.csv - Editor | |
|---------------------------|-----------|
| Datei Bearbeiten Format | |
| Farbcode;IC-Nummer | |
| 00001; | 121478242 |
| 00002; | 658447852 |
| 45875; | 121475284 |
| 59874; | 325874158 |
| 24714; | 002351478 |
| 21514; | 325654125 |
| 77757; | 704507440 |

8.12 GS1-128 Parser

NOTICE!

By means of this variable type, the content of an application identifier in a GS1-128 bar code can be determined.

| | | | | | |
|-----|----|-----|---|--------------------------|-----|
| SOH | BM | [n] | = | A I (p ; Ai) | ETB |
|-----|----|-----|---|--------------------------|-----|

= AI identification of GS1-128 parser
 p identification of the link element (field number)
 Ai application identifier

Example

Field 1 ="00123456789012345675" GS1-128 with AI00

=AI(1;"00") Printout: 123456789012345675

8.13 EPC Calculation (Electronic Product Code)

SOH | BM | [n] = E | P | C (| M ; L ; F ; P ; N1 ; {N2} |) | ETB

| | |
|-------|--|
| = EPC | identification of EPC calculation |
| M | coding method |
| L | length of manufacturer number (company prefix) |
| F | filter value |
| P | verification of check digit |
| N1 | identification of link element (field number) |
| N2 | identification of link element (field number) - optional |

For more information, visit the following web sites:

www.epcglobalinc.org or www.gs1.org

| Param. | Value range | | |
|--------|---------------------------------------|---|-----|
| M | 0 = coding method SSCC96 | 3 = coding method GRAI96 | |
| | 1 = coding method SGTIN96 | 4 = coding method GIAI96 | |
| | 2 = coding method SGLN96 | | |
| L | 6..12 | | |
| F | SSCC96 | All Others | 000 |
| | | Undefined | 001 |
| | | Logistical / Shipping Unit | 010 |
| | | All Others | 000 |
| | SGTIN96 | Retail Consumer Trade Item | 001 |
| | | Standard Trade Item Grouping | 010 |
| | | Single Shipping/ Consumer Trade Item | 011 |
| | | All Others | 000 |
| | SGLN | Physical Location | 001 |
| | | All Others | 000 |
| P | 0 = no verification; 1 = verification | | |
| N1, N2 | any | | |

Example 1

Field 1 ="00123456789012345675“ GS1-128 with AI00
 Field 2 =AI(1;“00“) --> Printout: 123456789012345675
 Field 3 =EPC(0;12;0;1;2) --> Printout: 3100DA7557D32C38E7000000
 The EPC is calculated with the content of Field 2. The coding method SSCC96 is used. In Field 2 a valid NVE must be represented (18-digit, correct check digit).

Example 2

Field 1 ="4141234567890128254123“ GS1-128 with AI00, AI254
 Field 2 =AI(1;“414“) --> Printout: 1234567890128
 Field 3 =AI(1;“254“) --> Printout: 123
 Field 4 =EPC(2;10;0;0;2;3) --> Printout: 3208499602D2180000000007B
 The EPC is calculated with the content of Field 2 and Field 3. The coding method SGLN96 is used. In Field 2 a valid ILN must be represented (13-digit). In the example, Field 3 contains an optional serial number. No verification of check digit of ILN (8) is effected.

* only when using option RFID

8.14 Check Digit

| | | | | | | | | | | | | | | | | | |
|-----|----|-----|---|-------|---|---|---|---|---|---|---|---|---|----|-----|-----|-----|
| SOH | BM | [n] | = | C D (| d | s | l | t | w | m | r | o |) | t1 | t.. | t70 | ETB |
|-----|----|-----|---|-------|---|---|---|---|---|---|---|---|---|----|-----|-----|-----|

- = CD Identification of check digit
- d Data for check digit calculation (field number of constant text)
Constant text is enclosed in "".
- s Start position within data
1 ...n Start calculation at digit x
- | Number of digits. If the parameter is not indicated, the remaining data (from start position) is used for the check digit calculation.
- t Check digit type
 - 0 Modulo 10 (weighting 3)
 - 1 Modulo 11
 - 2 Modulo 43
 - 3 Modulo 47 (weighting 15)
 - 4 Modulo 47 (weighting 20)
 - 5 Modulo 103
 - 6 Customized

Optional parameters for customized check digit

- w Weighting.
Constant text enclosed in "" - contains the individual weighting values or an interval.
Individual values: "x₁,x₂"
Interval: "x₁...x₂"
- m Modulo
- r Add result to
- o Print only one digit
 - 0 No
 - 1 Yes

Example

- | | |
|-----------|---------------------------------------|
| Entry: | =CD("123456789012";0;0;0) |
| Printout: | 8 |
| Entry: | =CD("1234567890";0;0;6;"1,3";10;10;1) |
| Printout: | 5 |

8.15 Substring

| | | | | | | | | | | | | | |
|-----|----|-----|---|---|---|---|---|---|---|---|---|---|-----|
| SOH | BM | [n] | = | S | S | (| d | ; | s | ; | I |) | ETB |
|-----|----|-----|---|---|---|---|---|---|---|---|---|---|-----|

- = SS Identification of substring
- d Data used for substring extraction (field number or field name or constant text).
Constant text is enclosed in "".
- s Start position within data. If this parameter is omitted, the substring extraction starts with the 1st character of the data string.
1 n Start at digit x
- I Number of digits. If this parameter is omitted, all characters from the start position to the end of the data string are returned.
1 ...n At the start position x digits

Example:

| | |
|-----------|---|
| Entry: | =SS("1234567890";4;3) |
| Printout: | 456 |
| | Field "ARTIKELNR" has the contents "370012330295" |
| Entry: | =SS(ARTIKELNR;1;4) |
| Printout: | 3700 |

9 Parameter Sets

9.1 Label Parameters

Set label photocell type

```
SOH F C D E - - r N - - - - - - ETB
```

N: 0 = transmission photocell normal

N: 1 = reflection photocell

N: 2 = transmission photocell inverse

N: 3 = reflection photocell inverse

N: 4 = Ultrasonic photocell (option for 103/12, 104/12, 106/12,
106/24, 108/12, 162/12)

Get label photocell type

```
SOH F C D E - - w p p p p p p p p ETB
```

Answer

```
SOH A N - - - - - - p p p p p p p p ETB
```

Set label type

```
SOH F C D A - - r N - - - - - - ETB
```

N: 0 = change to adhesive labels (automatically measure process)

N: 1 = change to continuous labels

Get label type

```
SOH F C D A - - w p p p p p p p p ETB
```

Answer

```
SOH A N - - - - - - p p p p p p p p ETB
```

Measure label

In case of loading a new label roll it is possible to start measuring by this command.

```
SOH F C B - - - r - - - - - - - - ETB
```

The current label and gap length in the printer can be sent to the Host computer:

```
SOH F C B - - - w p p p p p p p p ETB
```

After this command the printer sends the following answer:

Answer

```
SOH A E E E E S S S S p p p p p p p p ETB
```

EEEE = label length in mm (ASCII)

SSSS = gap length in mm (ASCII)

Set label length in 1/100 mm

| | | | | | | | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|
| SOH | F | C | C | L | - | - | r | N | N | N | N | N | N | - | ETB |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|

N = value of label length in 1/100 mm, 7 digit ASCII number

Get label length in 1/100 mm

| | | | | | | | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|
| SOH | F | C | C | L | - | - | w | N | N | N | N | N | N | - | ETB |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|

Answer

| | | | | | | | | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|
| SOH | A | N | N | N | N | N | N | - | p | p | p | p | p | p | p | ETB |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|

Set gap length in 1/100 mm

| | | | | | | | | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|
| SOH | F | C | C | M | - | - | r | M | M | M | M | M | - | - | - | ETB |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|

M = value of gap length in 1/100 mm, 5 digit ASCII number

Get gap length in 1/100 mm

9.4 Interface

By means of the following commands the parameters of the serial interface can be set. Note that after sending one of the commands also the host computer changes the corresponding parameter of its interface to allow further communication of host computer-printer.

For all interface commands the interface is fixed with x. The following values are allowed:

x = 1 ⇒ COM 1
x = 2 ⇒ COM 2

In all other cases automatically the first serial interface is addressed.
In the answers the addressed interface is also returned.

Set all interface parameters

| | | | | | | | | | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|
| SOH | F | C | F | F | x | - | r | m | ; | b | ; | p | ; | d | ; | s | ETB |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|

m = mode (0 = Off, 1 = On, 2 = On, without error message)

b = baud rate (2400, 4800, 9600, 19200, 38400, 115200)

p = parity (n = no parity, e = even parity, o = odd parity)

d = number of data bits (7, 8)

s = number of stop bits (1, 2)

Example: activate interface COM1 and set 9600 Baud, no parity, 8 data bits, 2 stop bits

[SOH]FCFF1-r1;9600;n;8;2[ETB]

Interface protocol

There are two different interface protocols available. Usually SOH = 01_{Hex} and

ETB = 17_{Hex}. However there are host computers (e.g. AS/400), which cannot work with these characters. Therefore you can switch SOH = 5E_{Hex} and ETB = 5F_{Hex}. The host computer has to change the corresponding parameter as well.

Set SOH and ETB

| | | | | | | | | | | | | | | | | |

9.5 Network

| | | | | | | | | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|
| SOH | F | C | L | A | - | - | r | C | 0 | A | 8 | 0 | 0 | 1 | 5 | ETB |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|

All network parameter sets start in the third column with a 'L'. Column 4 shows the identification for the corresponding network parameter. Column 5 can show another sub-identification.

Because of the fact that the argument size is limited to 8 characters, the IP addresses (IP address, network mask, gateway address) which consist of 32 bit are transmitted in HEX presentation.

For all data which is transmitted in HEX presentation (also the MAC address) it is allowed to use capital as well as small letters.

In contrary to the parameter settings of the other interfaces, the settings of the following sets were saved immediately onto Flash, i.e. it is not necessary to save the currently set configuration before switching off the printer so the modifications are still available after switching on.

So that the made modifications become active, also without printer Reset it is necessary to transmit a corresponding Z set which effects a Reset of the network devices.

SOH | F | C | L | M | A | - | r | 4 | 3 | 1 | 9 | 0 | 8 | - | - | ETB

SOH | F | C | L | M | C | - | r | 0 | 0 | 0 | 7 | 4 | A | 1 | 9 | 0 | 8 | ETB

A MAC address has a width of 48 bit and is normally indicated in hexadecimals.

With a B record it is possible to modify our identification of the MAC address. All our machines start with 00-07-4A as default. This corresponds to the Memory-Pool which the MAC address committee assigned to us to guarantee that the MAC address is world-wide manufacturer-spreading unique.

With the A record any address can be set in our pool.

With the C record any address in our pool and the identification of the MAC address can be set/changed at the same time.

NTP Server

NTP (Network Time Protocol) is a standardized Internet protocol permitting the synchronization of real-time clocks of network participants. The printer connects itself with a time server and align every 60 minutes its internal real-time clock with that of the time server in order to correct possible differences.

The address of server (IP address) can be freely configured in the printer. The communication is effected by UDP and the fixed set port 123. The service in the printer is deactivated by transmitting the server address 0.0.0.0.

The time servers work together with the coordinated world time (UTC) and therefore an additional time shift is needed compared to the reference time. For Germany it is e.g. +1 hour.

The current state of the connexion can be queried with a status set.

Automatically adjust clock for daylight saving changes

Because of the fact that there is no world-wide regulation if and when a changing of time between summer and wintertime (normal time) in the individual countries takes place, we distinguish between the following four formats for the definition for beginning and end of summertime.

| | |
|-------------|---|
| F 0: | European format start of summertime = last Sunday in March end of summertime = last Sunday in October |
| W: | week (1 = first, ..., 5 = last) |
| WD: | day of week (0 = Sunday, ..., 6 = Saturday) |
| MM: | month (01 = January, ..., 12 = December) |
| F 1: | Fix date with indication of year DD: day MM: month (01 = January, ..., 12 = December) YY: year |
| F 2: | Fix date without indication of year DD: day MM: month (01 = January, ..., 12 = December) |
| F 3: | Week day after day in month WD: day of week (0 = Sunday, ..., 6 = Saturday) DD: after day (only the first day is taken into consideration) MM: month (01 = January, ..., 12 = December) |

Set automatically adjust clock for daylight saving changes

| | | | | | | | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|

9.10 Compact Flash Card

Save a label onto Compact Flash card

| | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|-----|
| SOH | F | M | A | O | - | - | r | P | ETB |
|-----|---|---|---|---|---|---|---|---|-----|

- O: In case a label with the entered name exists already then the label is overwritten without an enquiry. If you enter another value as 0, an enquiry appears demanding if you want to overwrite.
 P: File name of the label which is to save. Drive and path name are optional, i.e. the file name is allowed to have more than 8 characters but is limited to 79.

Load a file from Compact Flash card

| | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|-----|
| SOH | F | M | B | - | - | - | r | P | ETB |
|-----|---|---|---|---|---|---|---|---|-----|

- P: File name of the layout which is to load. Drive and path name are optional, i.e. the file name is allowed to have more than 8 characters but is limited to 79.

Delete a layout from Compact Flash card

| | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|-----|
| SOH | F | M | C | - | - | - | r | P | ETB |
|-----|---|---|---|---|---|---|---|---|-----|

- P: File name of the layout which is to delete. Drive and path name are optional, i.e. the file name is allowed to have more than 8 characters but is limited to 79.

Format Compact Flash card

| | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|-----|
| SOH | F | M | D | - | - | - | r | P | ETB |
|-----|---|---|---|---|---|---|---|---|-----|

- P: Optional drive identification with colon (e.g. A:).
 In case no drive is indicated, then the currently selected is formatted.

Readout contents of CF card

| | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|-----|
| SOH | F | M | G | O | - | - | r | P | ETB |
|-----|---|---|---|---|---|---|---|---|-----|

- O: In case O is indicated, no error messages are displayed at the printing display e.g. if no card is inserted.
 P: Optional drive identification with colon (e.g. A:).
 In case no drive is indicated, then the currently selected is read out.

Answer

| | | | | | | |
|-----|--------------------------|--|--|--|--|-----|
| SOH | File name/directory name | | | | | ETB |
|-----|--------------------------|--|--|--|--|-----|

A list of all file entries is indicated, each entry is included in (SOH) and (ETB).

Readout free memory space

| | | | | | | | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|
| SOH | F | M | H | O | - | - | w | X | p | p | p | p | p | p | ETB |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|

O: In case O is indicated, no error messages are displayed at the printing display e.g. if no card is inserted.

X = Drive [A,B] (optional)

Answer

| | | | | | | | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|
| SOH | A | X | n | n | n | n | - | - | p | p | p | p | p | p | ETB |

|-----|---|---|---|---|---|---|------------|---|---|---|---|---|---|---|-----|

Item number of print order

By means of this command the Host computer can enquire following item numbers:

Total number of current print order

| | | | | | | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|
| SOH | F | B | B | A | - | - | w | p | p | p | p | p | p | ETB |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|

Number of labels which are still to print

| | | | | | | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|
| SOH | F | B | B | B | - | - | w | p | p | p | p | p | p | ETB |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|

Number of already printed labels

| | | | | | | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|
| SOH | F | B | B | C | - | - | w | p | p | p | p | p | p | ETB |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|

Interval in cutter mode

| | | | | | | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|
| SOH | F | B | B | D | - | - | w | p | p | p | p | p | p | ETB |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|

At the end of one of these commands the printer returns the corresponding number as ASCII value (4 res. 5 digits) in the answer set.

Answer

| | | | | | | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|
| SOH | A | N | N | N | N | - | - | - | p | p | p | p | p | ETB |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|

With this set it is also possible to transmit the item number of print order and the interval (in cutter mode) to the printer.

Item number of print order

| | | | | | | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|
| SOH | F | B | B | A | - | - | r | N | N | N | N | - | - | ETB |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|

NNNN = 5 digits item number of order

Interval in cutter mode

| | | | | | | | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|
| SOH | F | B | B | D | - | - | r | N | N | N | N | - | - | - | ETB |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|

NNNN = interval

Start printing

| | | | | | | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|
| SOH | F | B | C | - | - | r | S | - | - | - | - | - | - | ETB |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|

This command starts the print order which is actually set in the printer.
The current parameters such as print mode, speed, initialization etc.
are used.

S = x: sorted (e.g. pages 1-5, then again 1-5 etc. are printed)
S = 1: unsorted (page 1 is printed x times, then page 2 x times, etc.)

| | | | | | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|-----|
| SOH | F | B | D | - | - | r | S | - | - | - | - | - | ETB |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|-----|

Start printing (see above) but without tear off offset.

| | | | | | | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|
| SOH | F | B | E | - | - | r | n | n | n | n | n | n | n | ETB |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|

With this command the printjob identifier which appears in "printing"
res. "stopped" window is assigned to a print order. If only blanks are
transmitted, then the printjob identifier is deleted and the display
shows "noname".

Initialization of page handling

| | | | | | | | |
|-----|---|---|---|---|---|---|-----|
| SOH | F | B | F | - | - | r | ETB |
|-----|---|---|---|---|---|---|-----|

Selection of current page

| | | | | | | | | |
|-----|---|---|---|---|---|---|---|-----|
| SOH | F | B | G | - | - | r | P | ETB |
|-----|---|---|---|---|---|---|---|-----|

P = current page number [1... 9]

Select order of pages to be printed

| | | | | | | | | | | |
|-----|---|---|---|---|---|---|----------------|----------------|----------------|-----|
| SOH | F | B | H | - | - | r | P ₁ | P ₂ | P ₃ | ETB |
|-----|---|---|---|---|---|---|----------------|----------------|----------------|-----|

P₁; P₂; ... = pages to be printed

Generation of page without print start

| | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|-----|
| SOH | F | B | I | - | - | - | r | S | ETB |
|-----|---|---|---|---|---|---|---|---|-----|

With this command the corresponding page is only generated, i.e. no
print start signal is sent.

S = x: sorted (e.g. pages 1-5, then again 1-5 etc. are printed)
S = 1: unsorted (page 1 is printed x times, then page 2 x times, etc.)

Feed**Parameter set to release a feed**

| | | | | | | | | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|
| SOH | F | E | - | - | - | r | - | - | - | - | - | - | - | - | - | ETB |

N = currently set scanner type

Scanner Variable

In mode 1 (data comparison) it is necessary to fix the order of bar code data to scann several codes onto one label. Because of this reason bar code data has to be defined as scanner variable in text sets. The text set has the following structure:

| | | | | | | | | | | | | |
|-----|----|-----|---|---|---|---|---|---|---|---|-----------|-----|
| SOH | BM | [n] | = | S | V | (| a | ; | f |) | text data | ETB |
|-----|----|-----|---|---|---|---|---|---|---|---|-----------|-----|

=SV: identification scanner variable

a: field active (0 = not active, 1 = active, i.e. code is scanned)

f: field number for definition of code order (1 ...)

Examples:

Fixed text:

(SOH)BM[1]=SV(1;1)123456(ETB)

Variable text (counter):

(SOH)BM[1]=SV(1;1)=CN(10;0;4;+1;1)0001(ETB)

11 Configuration & Status

Save configuration permanent

In case you want to save the described settings permanent into the printer, then you have to transmit the following command to the printer.

| | | | | | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|-----|
| SOH | F | X | - | - | - | r | N | - | - | - | - | - | ETB |
|-----|---|---|---|---|---|---|---|---|---|---|---|---|-----|

N: 0 = save current parameter

N: 1 = set all parameters to default values

Then the printer performs a restart

Read configuration

| | | | | | | | | | | | | |
|-----|---|---|---|---|---|---|---|---|---|---|---|-----|
| SOH | F | X | - | - | - | w | - | - | - | - | - | ETB |
|-----|---|---|---|---|---|---|---|---|---|---|---|-----|

The printer sends as answer all current settings as parameter sets.

Status enquiry

Host computer can receive information about the printer by the serial interface.

The status enquiry has the following data format:

| | | |
|-----|---|-----|
| SOH | S | ETB |
|-----|---|-----|

Status return information

After receiving the status enquiry the printer sends the corresponding status return information.

Data format of status enquiry

| | | | | |
|-----|-----------------|-----------------|-------------|-----|
| SOH | 1. Byte | 2. Byte | 5.-1. digit | ETB |
| | 8 7 6 5 4 3 2 1 | 8 7 6 5 4 3 2 1 | | |

| | | |
|-------------|---|---|
| 1. Byte | = | 1. Status byte |
| | | 8. Bit = free 7. Bit = always set 6. Bit = free 5. Bit = 1 = running print order 0 = no. of items (0 = no print order) 4. Bit = 1 = press stop key 0 = not pressed stop key 3. Bit = cutter error (0 = no error; 1 = error) 2. Bit = label material (0 = no error; 1 = error) 1. Bit transfer ribbon (0 = no error; 1 = error) |
| 2. Byte | = | 2. Status byte |
| | | 8. Bit – 4. Bit = free 3. Bit = Compact Flash card 2. Bit = Mask set 1. Bit = Printhead temperature |
| 5.-1. digit | = | number of pieces with 5 digits as ASCII characters min. '00000' / max. '65535' |

11.1 Autostatus

The printers are equipped with an auto status function, i.e. in certain operating modes the printer actively sends the corresponding status. This can be enquired by the serial interface.

To activate the auto status, the host computer has to send the following command to the printer:

| | | | | |
|-----|---|---------|---------|-----|
| SOH | G | 1. Byte | 2. Byte | ETB |
|-----|---|---------|---------|-----|

Each of the below indicated message which is observed and send by the printer has to be transmitted with a set Bit (see table below 1. Byte and 2. Byte) to the printer by means of auto state function. The printer sends after each performed condition the corresponding message (answer) to the host computer.

The following messages are provided:

1 Start of generation

2 End of generation

The printer sends this state in case data for a complete label was generated. The test print was not taken into consideration.

For counters/date variables the printer sends for each label a status cycle (start, end).

3 Start of printing

4 End of printing

The start of the print is send in case the generated data is send. The end of the print is send in case the print of the label is finished and the motor has stopped.

5 Start of cutting

6 End of cutting

This status describes the cutting. It can be checked for timeout and the end of the cut movement → error.

7 Start of feeding

8 End of feeding

This status is send in case an additional feeding (dispenser, cutter, tear off) is released.

9 Start of a print order

10 End of print order

This status signalizes the start and end of a complete print order (1...99999 labels). This status is active in all operating modes.

11 Error

This status message is send in case an error occurs.

12 Printing stopped

This message is send if the printing is stopped.

13 Printing resumed

This message is send if the printing is resumed.

The printer sends the auto status in the following format to the host computer:

| | | | | |
|-----|---|---------|---------|-----|
| SOH | G | 1. Byte | 2. Byte | ETB |
|-----|---|---------|---------|-----|

1. Byte

- | | |
|------------------------------|------------------------|
| 8. Bit = start of generation | 4. Bit = start cutting |
| 7. Bit = end of generation | 3. Bit = end of cut |
| 6. Bit = start printing | 2. Bit = start feeding |
| 5. Bit = end of print | 1. Bit = always 0 |

2. Byte

- | | |
|-------------------------------|---------------------------|
| 8. Bit = end of label feed | 4. Bit = free |
| 7. Bit = start of print order | 3. Bit = printing stopped |
| 6. Bit = end of print order | 2. Bit = printing resumed |
| 5. Bit = error | 1. Bit = always 0 |

NOTICE!

Bit 1 has to be in 1. Byte and 2. Byte always 0, otherwise the printer possibly could recognize SOH or ETB.

At the status message of the printer to the host computer always at least 1 Bit is set. However, it could be occur that several Bits are set at the same time.

At the status demand of the host computer to the printer it is also possible that several Bits are set at the same time.

The auto status demand is saved in the printer, i.e. it is set to 0 after switching off/on. Therefore it is necessary to demand it anew after each time the printer is switched on.

Example

The printer should observe the start of a print order. For this the host computer sends the following demand to the printer.

| | | | | |
|-----|---|----------|----------|-----|
| SOH | G | 00000000 | 01000000 | ETB |
|-----|---|----------|----------|-----|

After the condition is fulfilled (= start of the print order) the printer sends the following message to the host computer:

| | | | | |
|-----|---|----------|----------|-----|
| SOH | G | 00000000 | 01000000 | ETB |
|-----|---|----------|----------|-----|

With regard to the contents the answer corresponds always to the format set.

12 Monitored Printing

This protocol replaces the outdated Autostatus. In contrary to the Autostatus, this is not a binary protocol but a text-based protocol sending the commands as English clear text. The advantage is a very fast and simple error tracing and development. The disadvantage of a larger data volume plays nowadays a smaller role.

12.1 Short Introduction

In order to activate monitored printing:

(SOH)FHM---rSE(ETB)
(SOH)FHA---r2(ETB)

12.2 Parameter Sets (Host – Printer)

Formatting: # - SOH * - ETB

Command: Set monitoring mode.

Syntax: #FHM---rSE $PnnnCnFn^*$

Example: #FHM---rSP10E*

Description: Activates the forwarding of certain events to the server.

The results are:

S - (start/stop): print start, print end, stop printing, continue printing, cancel printing.

E – (error): Error occurred, error confirmed.

C – (photocell): Activates the photocell test (n=1)/disable (n=0)

F – Activates the encoder profile (n=1)/disable (n=0)

P – (progress): Print progress, indicates the number of already printed labels. In standard case, the interval between two events is a label. If a number behind the flag is indicated, an event every nnn labels is released (see example). With column printing the event is released, as soon as the entered interval was reached or exceeded for the first time (example: 3 columns, interval 4, 20 labels in total. Event at label 6,9,12 and 18).

Command: Activate, disable the monitoring.

Syntax: #FHA---rn*

Example: #FHA---r2*

Description: activated, deactivates the monitoring (n=[0,2]);

,0' – enables the monitoring after completion of print order,

,1' – reserved

,2' – activates the monitoring for the current port.

12.3 Direct Enquiry

Command: Requests print status.

Syntax: #FHS---r*

Example: #FHS---r*

Description: Invites the client to send the current status.

Command: User command to the sender of print order.

Syntax: #FHU---r*Daten**

Example: #FHU---rSE*

Description: Sends #*Data** to the sender of print order.
Max 100 characters.

12.4 Answer Sets (Printer – Host)

Event: Print start

Set: #HSStart-*Pagename-Labelsrequested**

Example: #HSStart-NoName1-100*

Description: Indicates the start of a print order, including page name and number of labels to be printed.

Event: Printing completed

Set: #HSDone-*Pagename-Labelsprinted**

Example: #HSDone-NoName1-100*

Description: Indicates the completion of a print order including page name and number of printed labels.

Event: Printing stopped

Set: #HSHold-*Pagename-Labelsprinted**

Example: #HSHold-NoName1-10*

Description: Indicates the stopping of print order including page name and number of printed labels. Occurs when the user stopped the print order and/or after occurrence of an error.

Event: Continue printing

Set: #HSContinue-*Pagename-Labelsprinted**

Example: #HSContinue-NoName1-55*

Description: Indicates the continuation of print order including page name and number of printed labels. Occurs when the user restarts the print order.

Event: Cancel printing

Set: #HSAborted-*Pagename-Labelsprinted**

Example: #HSAborted-NoName1-57*

Description: Indicates the cancelation of printing including page name and number of printed labels.

Event: Error
Set: #HSError-*Pagename-Labelsprinted-ErrorID-Errormessage**
Example: #HSError-NoName1-57-28-Messerfehler*
Description: Indicates the occurrence of an error including page name, number of printed labels, error ID and error text.

Event: Error confirmation at printer
Set: #HSAck-*Pagename-Labelsprinted* *
Example: #HSAck-NoName1-57*
Description: Indicates the confirmation of an error including page name and number of printed labels.

Event: Print progress
Set: #HSProgress-*Pagename-Labelsprinted* *
Example: #HSProgress-NoName1-60*
Description: Indicates the progress of print order including page name and number of printed labels. This event is also returned as answer to status enquiry, if the printer is printing.

Event: Photocell value
Set: #HSPhotocell-DLS:xxx-RLS:xxx*
Example: #HSPhotocell-DLS:3.8-RLS:1.9*
Description: Returns the values of transmission and reflexion photocell. The verification takes place every 5 ms; only changes are sent.

Event: Encoder profile
Set: # HSEnc-Dist:xxx-Speed:xxx*
Example: # HSEnc-Dist:120-Speed:202*
Description: Generates the profile of speed development of the packaging machine during a print order.

Event: Answer to status enquiry (#FHS---r*)
Description: The respective current print event is returned.

12.5 Sample Label

A simple label with monitoring of all parameters with output of the progress – all 10 labels could look as following:

```
FHM---rSP10E
//Ueberwachung einschalten
FHA---r2
// JOBNAME: "ETIKETT1"
FBE---rETIKETT1
// TYPE: Endlosetiketten
// HEIGHT: 20.00 mm
// GAPLENGTH: 2.00 mm
// COLUMNS: 1
// COLUMN DISTANCE: 100.00 mm
FCDA--r1-----
FCCL--r0002000-
FCCM--r00000---
FCCHA--r1-----
FCCHB--r999-----
// SPEED: 50 mm/s
FCAA--r050-----
// CONTRAST: 200%
FCAB--r200-----
// LABELCONTROL: 0
